

# Airport cold joints are heat resistant

## Overview

Temperature Resilience: Cold-rieveted joints retain their strength even in extreme temperatures, whether during scorching heat on the runway or freezing temperatures at cruising altitude. This is where cold riveting steps in as a time-tested fastening technique that ensures durability, strength, and resilience in aerospace engineering. To mitigate these. For joints on demanding airport runways and taxiways, you can trust the proven silicone sealants from Dow. Backed by more than 20 years of silicone construction expertise, Dow's silicone pavement sealants resist UV radiation, temperature and weather extremes to ensure a durable, long-lasting. 605-1. 1 This item shall consist of providing and installing a resilient and adhesive joint sealing filler capable of effectively sealing joints and cracks in pavements.
