

Dawning Server Access Switch

AI Overview

An access switch connects servers and end devices to the network, providing high port density, Layer 2/Layer 3 connectivity, and essential management and security features. Role of Access Switches Access switches are deployed at the access layer of a network hierarchy, directly connecting servers, workstations, IP phones, and other endpoint devices to the network. In a data center environment, such as with Dawning servers, access switches typically operate in Layer 2 mode, allowing VLAN extension, NIC teaming, and high availability clustering. They ensure that data packets are delivered efficiently to the connected devices while maintaining network segmentation and security. Key Features Port Density: Access switches have a high number of ports to connect multiple servers or devices, reducing the need for additional switches. Port Speed: Commonly support 10/100/1000 Mbps, with some models offering 2.5G or 10G uplinks for high-performance server connections. Power over Ethernet (PoE): Some access switches can supply power to endpoint devices like IP cameras or wireless access points. Security: Built-in features include port security, 802.1X authentication, and VLAN segmentation to protect server and network traffic. Management: Access switches can be managed or unmanaged, with managed switches offering configuration, monitoring, and troubleshooting capabilities. Deployment in Server Environments In a typical data center access layer, access switches connect to distribution or aggregation switches, which then link to core switches for high-speed backbone connectivity. This hierarchical design ensures: Efficient routing of traffic from servers to the network backbone. High availability through link aggregation and redundancy. Simplified VLAN management and server provisioning. Access switches are critical for server performance and reliability, as they handle the majority of direct connections to servers and end devices. Proper selection of port density, speed, and Layer 2/Layer 3 capabilities en...
