

Denmark construction site three-level distribution box

Overview

The power distribution from the power input point to the end electrical equipment needs to go through three levels of Powbinet. This architecture uses the main distribution box as the primary hub, with several sub-distribution boxes at lower levels, forming a tree-like. The construction power distribution cabinet is designed specifically for the special situation of the construction site and complies with the relevant construction electricity specifications and standards of the construction department. If anyone is interested, I have found the Danish Electrical Regulations. The following is a detailed introduction about it: - **First-level Distribution. The range of applications extends from pure energy distribution in buildings to building automation and through to industrial plants. SMART DISTRIBUTION BOXES FOR FLEXIBLE BUILDINGS.
