

Fiber optic router s optical signal light turns red

AI Overview

A red LOS (Loss of Signal) light on your fiber optic router indicates that the router is not receiving a proper optical signal from your ISP, often due to cable issues, power problems, or service outages.

Common Causes

- Fiber Optic Cable Damage:** Physical cuts, bends, or kinks in the fiber cable can disrupt the signal and trigger a red LOS light.
- Service Outage:** ISP maintenance or local network issues can prevent your router from receiving a signal.
- Loose or Faulty Connections:** Improperly connected or damaged connectors on the fiber cable, power cable, or LAN cables can cause signal loss.
- Router or ONT Malfunction:** A defective router or Optical Network Terminal (ONT) may fail to process the incoming signal.
- Power Issues:** Fluctuations or insufficient power supply can prevent the router from functioning correctly.

Troubleshooting Steps

- Check for ISP Outages:** Visit your ISP's website or social media pages to see if there is a known service disruption in your area.
- Inspect the Fiber Cable:** Look for visible damage, sharp bends, or loose connections. Ensure the fiber is securely connected to the WAN/ONT port.
- Power Cycle the Router/ONT:** Turn off the device, unplug it from the power source for 20-30 seconds, then reconnect and power it on. Wait a few minutes for the device to boot fully.
- Check All Connections:** Ensure the power adapter, LAN cables, and fiber connectors are firmly seated. If connectors appear loose, reseal them gently.
- Test with Neighbors or ISP Support:** If others in your area have the same issue, it may indicate a line-side problem that requires ISP intervention.

When to Call Your ISP

If the LOS light remains red after performing the above steps, the problem is likely outside your home, such as a damaged fiber line or network issue. Contact your ISP for a technician visit or line verification. By following these steps, you can often identify whether the red LOS light is due to a simple in-h...
