

How to coil fused fiber cables so they don't get tangled

Overview

The most effective and widely recommended method for coiling cables is the over-under technique, also sometimes referred to as the figure-eight method. This technique actively neutralizes the natural twist of the cable, preventing kinks and maintaining flexibility. Therefore, it is necessary to avoid bird's-nest fiber coiling; to coil fiber well is a meticulous job that requires great patience and does not allow for any sloppiness. Before fiber coiling, the optical cable and pigtail should be pre-processed, and the optical cable and pigtail should be opened. The necessary condition for fusion splicing is a qualified fiber end face, and its quality directly affects the quality of fusion splicing.
