

How to wrap the jumper wires in an invisible panel

Overview

Wire wrapping is a solderless method for bonding jumper wires to circuit boards. This technique involves wrapping the wire tightly around a square post on the board, creating a secure mechanical and electrical connection. Strip about 25mm (1 inch) of insulation from the end of the wire. The wire wrap technique and tools facilitate semipermanent electrical connections for low current applications. This procedure covers the repair/modification of printed boards and electronic assemblies using. To bond jumper wires to a circuit board, you will need the following tools and materials: Before bonding the jumper wires to the circuit board, you need to prepare them by stripping the insulation and tinning the exposed wire. Some of these wire strippers feature the ability to.
