

Installation of Middle Eastern Polymer Cable Trays

AI Overview

Polymer cable trays in the Middle East offer corrosion resistance, lightweight handling, and compliance with international standards, making them ideal for electrical and data cabling installations.

Overview of Polymer Cable Trays

Polymer cable trays, often made from pultruded polyester resin or vinyl ester, are designed to provide high corrosion resistance, lightweight construction, and durability comparable to steel trays. These trays are particularly suitable for harsh environments, such as coastal areas, chemical plants, or regions with high humidity, which are common in the Middle East. They are available in ladder, perforated, and solid-bottom designs, allowing flexibility for low-voltage, data, and power cabling.

Material and Standards

Middle Eastern manufacturers, such as Unitech, Tamco, and Power Solution Industries, produce polymer cable trays in compliance with BS 61537:2002 for cable installations and adhere to ISO and EN standards for finishes and corrosion protection. Polymer trays are often lightweight, non-conductive, and resistant to UV and chemical exposure, making them suitable for both indoor and outdoor installations.

Installation Guidelines

Support and Spacing:

Maintain proper support intervals to prevent sagging; typical rung spacing is 150–230 mm for ladder-style trays. Use polymer-compatible brackets and hangers to avoid galvanic corrosion when connecting to metal supports.

Load Considerations:

Determine the tray duty (light, medium, or heavy) based on cable type and weight. Light-duty trays are suitable for networking and fiber optics, while heavy-duty trays support industrial power cables. Ensure the tray's load rating matches the expected cable weight and environmental conditions.

Routing and Bends:

Maintain the minimum bend radius for cables exiting the tray to prevent damage. Use elbows, tees, and reducers designed...
