

Lighting circuit breaker tripped in home electrical control panel

Overview

When a lighting circuit trips, the first step is to safely reset the breaker by firmly flipping it fully to the OFF position, and then back to the ON position. If the breaker trips again immediately, a severe short circuit or ground fault likely exists, and troubleshooting should. This event, often called a “light trip,” is a sudden interruption of power to a specific section of your home's electrical wiring. The interruption is triggered by a specialized safety device, such as a standard circuit breaker, a Ground Fault Circuit Interrupter (GFCI), or an Arc Fault Circuit. Circuit breakers are designed to cut power automatically when they detect an electrical fault, preventing wires from overheating and reducing the risk of house fires. Understanding why breakers trip is the first step toward resolving the issue safely. But what's causing it?

And more importantly, does it need an expensive fix, or is this something simple?

The good news: Most circuit breaker trips have straightforward explanations, and many don't require major repairs.
