

Optical Module Control Code

Overview

The optical module coding acts as a digital fingerprint that is inscribed into each transceiver's EEPROM—a memory chip. This fingerprint reveals important information including speed rating, wavelength, supported distance, and power levels. This chapter introduces Application Select (AppSel) code provisioning, a key feature for configuring the operating modes of optical modules. In addition to. Integrated circuits and reference designs help you create a smaller and faster optical module design used in high-bandwidth data communication applications. Whether you are creating a 100-Gbps or 400-Gbps, small form-factor pluggable (SFP) module, SFP+ transceiver, XFP module, CFP, X2/XENPAK module. The Transmitter Optical Sub Assembly (TOSA) is responsible for the emission of light.
