

Optical Module Shielding Cage

Overview

An SFP cage is a metal frame assembly soldered onto a host board (like a switch, router, or network interface card). It provides:

- Secure Physical Housing:** Precisely holds the SFP module in place.
- Electrical Interface:** Connects the module's electrical contacts to the host board via a.

Choosing the wrong cage can lead to a cascade of problems: unreliable connections, overheating modules, difficulty inserting/removing optics, electromagnetic interference (EMI), and even premature hardware failure. This guide cuts through the complexity, providing network engineers, data center. An SFP Cage is a metal shielding enclosure mounted on a PCB that secures an SFP transceiver while providing mechanical retention, thermal dissipation, EMI shielding, grounding continuity, and optical alignment. What are the most critical factors in SFP Cage design and selection?

Thermal Management: Precision-manufactured SFP modules, SFP+ cage assemblies, and fiber optic connectors (LC, SC, ST) engineered for high-speed signal integrity in data center and telecom environments. The parts are designed for industry-wide compatibility and are tuned for optimal performance up to 10 Gbps.
