

SFP optical module emits light

Overview

Laser diodes (LDs) are the standard light-emitting components in most modern optical modules—including all Weunion SFP transceivers. These modules, including SFP, SFP+, and SFP28, are widely used in enterprise networks, data centers, and carrier-grade deployments. SFP modules work as transceivers, converting serial electrical signals to serial optical signals and vice versa. These optical signals are then passed through the fiber. SFP (Small Form-factor Pluggable) is a compact, hot-pluggable network interface module used to connect network devices (switches, routers, firewalls) to fiber optic or copper cables. This ensures consistent performance across temperature ranges (-40°C to 85°C) and harsh network.
