

Standards for Inspection Requirements of Construction Site Electrical Distribution Boxes

AI Overview

Electrical distribution boxes on construction sites must be installed, maintained, and inspected according to safety standards, with proper earthing, protective devices, labeling, and regular testing to prevent hazards.

Installation and Safety Requirements Electrical distribution boxes (DBs) on construction sites should be mounted on non-combustible metal frames and positioned in weatherproof or protected locations to prevent unauthorized access and accidental contact with live parts. All DBs must have cover plates, clearly labeled circuits, and a circuit diagram displayed externally. Temporary and permanent cabling should be armoured or PVC-sheathed, properly terminated, and routed to minimize obstruction and risk of damage.

Protective Devices and Earthing Each DB must include efficient protective devices such as fuses, moulded circuit breakers, RCDs, or ELCBs. The entire distribution system must be efficiently earthed, with earth continuity conductors tested using a loop tester at currents around 20 amperes. The impedance of the earth conductor should not exceed 1 ohm and must correspond to the ratings of protective devices. Pull wires from main circuit breakers should be installed to allow rapid isolation in emergencies.

Inspection and Testing Standards Inspection and testing of DBs should follow recognized standards such as BS 7671:2018 Section 704, IET Guidance Note 3, and OSHA/NEC requirements. Key points include:

- Formal inspections:** Conducted monthly for in-service equipment and every three months for combined inspection and testing of site installations.
- Certificate of Compliance (COC):** Must be issued by a competent person and displayed on the DB.
- Portable tools and...**

Article Content

1926.405

Metal raceways, cable armor, and other metal enclosures for conductors shall be metallically joined together into a continuous electric conductor and shall be so connected to all boxes, fittings, and

1926.403

Electric equipment shall be firmly secured to the surface on which it is mounted. Wooden plugs driven into holes in masonry, concrete, plaster, or similar materials shall not be used.

Requirements for distribution box at construction site

2□ The rated value and action setting value of the main distribution box shall be compatible with the rated value and action setting value of the branch switch. 3□
