

What adhesive is used for splicing fiber optic pigtails

Overview

Some methods factory make the connector with a fiber stub which is spliced to the fiber for termination. However, either epoxy or anaerobic adhesives followed by polishing have been determined to be the best methods. Unlike a patch cord—which has connectors on both ends—the bare fiber end of a pigtail is designed to be permanently spliced (either by fusion or. A fiber pigtail is a short length of optical fiber that comes with a high-quality, factory-polished connector already installed on one end, leaving a length of exposed glass on the other. Common types include single-mode OS2, multimode OM3/OM4. Manufacturers have invented and tested many different ways of attaching a connector to that hair-thin strand of glass, including various methods of gluing, crimping or clamping. Use alcohol wipes to remove dust and debris. Make a precise cut for optimal splicing.
