

# What is the model of the Alz distribution box

## AI Overview

The ALZ distribution box corresponds to the Azure Landing Zone reference implementation, typically deployed using ARM templates or Bicep modules, aligned with the Enterprise-Scale architecture (v3 and beyond). Overview The Azure Landing Zone (ALZ) is a logical construct that provides a secure, governed foundation for deploying workloads in Azure. It is not a physical device but a deployment model that defines how resources, policies, and management groups are structured across an enterprise Azure environment. The ALZ ensures that networking, identity, access management, and governance are in place before applications are deployed, similar to how utilities are pre-installed in a city before new houses are built. ALZ

Deployment Models There are multiple reference implementations for ALZ, which can be considered the "model" of the distribution box: ARM Template-Based Deployment: Uses the main ARM template (eslzArm.json) to orchestrate the full ALZ deployment. This method supports automation through Azure CLI, PowerShell, or DevOps pipelines.

Bicep Module Deployment: A modular and maintainable approach using Microsoft's Bicep language. Bicep modules allow partial or full deployment of ALZ components, such as management groups, policies, and shared services.

Portal Accelerator: A guided deployment experience through the Azure portal, ideal for users preferring a visual interface. It uses a custom deployment file (eslz-portal.json) to implement the ALZ framework. Architecture Version The current ALZ architecture is v3 and beyond, emphasizing modularity, automation, and alignment with Microsoft best practices. It is built around:

Management Group Hierarchy: Tenant Root Group, Platform, Workloads, and Shared Services. Baseline Policies and Governance Services: Ensures compliance and security across subscriptions. Shared Platform Resources: Networki...
