

Working principle of optical cables in equipment

Overview

The secret to how does an optical cable work lies in a phenomenon called total internal reflection. The communication using optical fiber cable can be a technique of transmitting data from one location to another by transmitting light pulses. At present, these cables are used for communication like sending images, voice messages, etc. However, it is not always easy to find out what has been covered, and where it can be found. This article provides the basic principles needed to work with this technology. In essence, light bounces down a thin strand of glass or plastic, carrying information at incredible speeds, making them essential for modern communication.
